第1天 项目初始与学科管理

6.6 删除学科

如果学科下有学科目录或学科下有标签,不能删除,需要给删除用户提示。只有在学科下没有任何级联数据的情况下,才可以删除。故需要在删除学科时,先查询学科目录或学科标签的数量。

6.6.1 修订CourseDao接口及映射文件

```
/**

* 删除学科信息

* @param id

*/
Integer deleteCourse(Integer id);
/**

* 统计学科下标签数量

* @param id

* @return

*/
Long selectCountTagById(Integer id);

/**

* 统计学科下目录数量

* @param id

* @return

*/
Long selectCountCatalogById(Integer id);
```

```
<delete id="deleteCourse">
    DELETE FROM t_course
    WHERE id = #{id}

</delete>
<select id="selectCountTagById" resultType="java.lang.Long">
    SELECT count(*) FROM t_tag
    WHERE course_id = #{id}

</select>
<select id="selectCountCatalogById" resultType="java.lang.Long">
    SELECT COUNT(*) FROM t_catalog
    WHERE course_id = #{id}

</select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select></select</select></select></select></select</select</select></select></select</select></select></select></sele
```

6.6.2 修订CourseService接口及实现类

```
/**

* 删除某一学科

* @param id

*/

void deleteCourse(Integer id);
```

```
/**
 * 检查学科是否有学科目录或学科标签
```

```
* 如果有提示用户不能删除
    * 如果没有执行删除
    * 提交保存
    */
@override
public void deleteCourse(Integer id) {
   SqlSession sqlSession = getSession();
   log.info("deleteCourse,id:{}",id);
   try{
       CourseDao courseDao = getDao(sqlSession,CourseDao.class);
       Long cataLogQty = courseDao.selectCountCatalogById(id);
       Long tagQty = courseDao.selectCountTagById(id);
       if( cataLogQty > 0 || tagQty > 0 ){
           throw new MmDaoException("学科下有数据,不能删除学科数据");
       Integer result = courseDao.deleteCourse(id);
       if (result == 0){
           throw new MmDaoException("删除学科失败");
       }
       commitAndCloseSession(sqlSession);
   }catch(MmDaoException e){
       closeSession(sqlSession);
       log.error("deleteCourse",e);
       throw new MmDaoException(e.getMessage());
   }
}
```

6.6.3 修订CourseController及Service调用

```
/**
    * 删除学科
    * 获取学科ID
     * 调用Service完成业务(courseService.deleteCourse(Integer)
    * 返回JSON到前端
    * @param request
    * @param response
    * @throws ServletException
    * @throws IOException
    */
@HmRequestMapping("/course/delete")
public void deleteCourse(HttpServletRequest request, HttpServletResponse
response) throws ServletException, IOException{
   try{
        String courseId = request.getParameter("courseId");
        courseService.deleteCourse(Integer.parseInt(courseId));
        printResult(response, new Result(true, "删除学科成功"));
   }catch(RuntimeException e){
       log.error("deleteCourse",e);
        printResult(response, new Result(false, e.getMessage()));
   }
}
```

6.6.4 测试接口

6.6.5 编写前端代码

在courseList.html中找到handleDeleted方法,加入axios请求。

```
// 删除学科
handleDeleted(row) {
this.$confirm('此操作将永久删除学科' + ', 是否继续?', '提示', {
 type: 'warning'
}).then(() => {
 //this.$message.success("删除成功");
 //this.getList();
  axios.get(app_path+"/course/delete.do?courseId="+row.id).then((response)=>{
  if(response.data.flag){
   this.$message.success(response.data.message);
  }else{
   this.$message.error(response.data.message)
  }
  this.getList();
 });
 }).catch(() => {
  this.$message.info('己取消操作!')
});
}
```
